Vevo Technologies

Copenhagen, Denmark

Dear Vevo Hiring Team,

I'm writing to register my interest in joining Vevo, particularly in a data or machine learning engineering role. I think there's a strong overlap between what I've been working on and what Vevo does, and I want to explain why.

My MSc thesis at the IT University of Copenhagen is on predicting corner kick outcomes in football using graph neural networks and player tracking data. I built a two-stage GNN pipeline that takes SkillCorner tracking data, constructs graph representations of corner kick situations, and predicts both receiver identification and shot probability. The work involved building the full ML pipeline from scratch: data processing, graph construction from raw tracking coordinates, model training with cross-validation, ablation studies, and statistical validation through permutation testing. The core finding was that tracking-based features, especially player velocity, significantly outperform freeze-frame data alone. This is exactly the kind of problem space Vevo operates in, using camera and tracking data to extract meaningful insights from football matches.

Beyond the thesis, I've been working as a software developer at PeopleNet A/S for the past few years, building backend services and data pipelines in Python, SQL, and C# on Azure. I also built telemetry processing pipelines for the DISCO-2 CubeSat satellite project, which taught me a lot about handling noisy, real-time data from distributed sources. I'm comfortable across the full stack of getting data from raw collection through to production systems.

What draws me to Vevo specifically is that you're solving the same fundamental problem I've been working on in my thesis: turning raw sports video and tracking data into something useful. The scale of 50,000+ clubs across 90+ countries makes the engineering challenges around data infrastructure and ML deployment really compelling. I want to work somewhere where the ML isn't a side project but the actual product.

I speak Danish natively and English fluently, and I'm based in Copenhagen. I'd welcome the chance to discuss where I could contribute at Vevo.

Best regards,

Mahmood Seoud
